Streptomycin may have a toxic effect on the vestibular analyzer: after prolonged injection into dogs we find either a shortening or a complete extinction of the period of postrotational nystagmus, depending upon the total quantity of drug administered. Bilateral impairment of function of the vestibular analyzer is specific for toxic doses of streptomycin under these conditions. Experiments have shown that the dance of bees, like any other unconditioned reflex (instinct) of an animal, can be controlled by conditioned reflexes, if the physiological mechanisms by which they proceed are known. By experimentally changing the behavior of individual worker bees, the flight activity of the entire colony can be changed, since it is known that a dancing bee mobilizes 5 to 10 times as many bees from the hive to go out to the plants as does a non-dancing bee. We describe a maneuver equivalent to that of Marchetti to  
determine the result of retropubic suspension of the  
urethra. This is applicable in cases in which Marchetti's  
test is not feasible. The patient's incontinence was  
treated with the technique of Marshall Marchetti with an
